

PHASE 1

Wall and grille as currently proposed by PHP
New partition to be as close as possible to rear brick wall (even if that exposes part of the window)

Current proposed grille pushed (if possible) as far to the right as possible. Wall positioned roughly as shown i.e. small reveal to brick pillar on gallery side but otherwise set back as far as possible on gallery side

Note:
For the proposed Phase 2 slender grille, we need to establish its minimum depth from the ceiling in order to determine the optimum wall height because in order to have tops of all display walls at the same level, the height of the long display wall in the gallery opposite the windows will be determined by this dimension

PHASE 2

Additional partition built in front of phase one partition (aligned to completely conceal window) with slender recessed grille at top abutting ceiling.

Additional partition built in front of phase one partition (positioned to create reveals to brickwork) with slender recessed grille at RHS abutting brick wall.
